

Circumference and Arc Lengths Notes

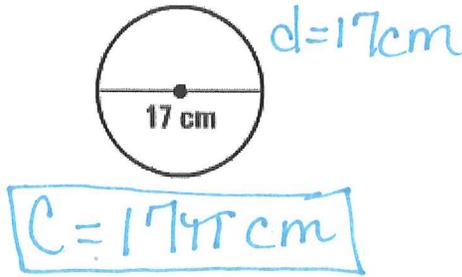

$C = 2\pi r$ or $C = d\pi$

Use the diagram to find the indicated measure.

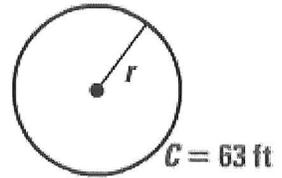

1. Find the circumference

2. Find the circumference

3. Find the radius

$C = d\pi$ MS.S
 $\frac{63}{\pi} = \frac{d\pi}{\pi}$ Plugs in π key
 $d \approx 20.05352283$
 $\div 2$
 $r = 10.026761415$

Find the indicated measure.

4. The circumference of a circle with diameter 5 inches.

$d = 5$
 $C = 5\pi \text{ in}$

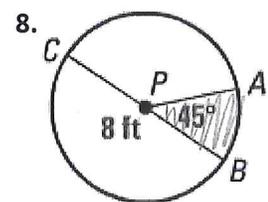

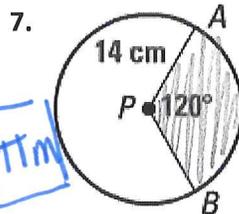

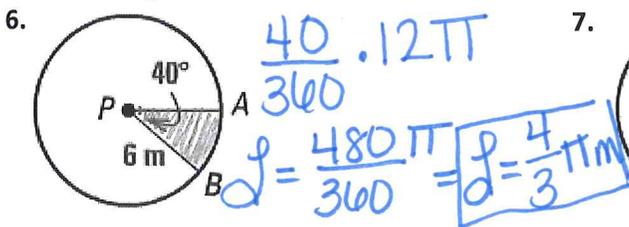

5. The radius of a circle with circumference of 28π meters.

$C = 28\pi$
 $d\pi = 28\pi$
 $d = 28 \text{ m}$
 $C = d\pi$
So $r = 14 \text{ m}$

Arc Length

$\frac{a}{360} \cdot C = \text{arc length}$

Find the length of \widehat{AB} .

We are using 40° of the 360° circle. The fraction of the circumference is the arc length. $\frac{40}{360}$ is the % of circumference we are using.

$C = 28\pi \text{ cm}$

$s = \frac{120}{360} 28\pi$

Calculator:
 $120 \times 28 = \frac{3360\pi}{360}$

* Now simplify!!*

$s = \frac{28\pi}{3} \text{ cm}$

$C = 8\pi \text{ ft}$

$s = \frac{45}{360} \cdot 8\pi$

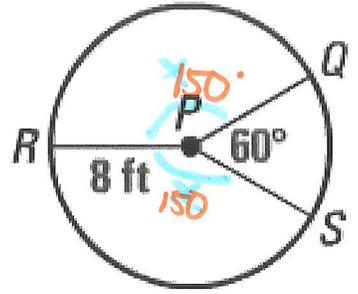

$= \frac{360\pi}{360}$

$s = 1\pi \text{ ft}$

In $\odot P$ shown at right, $\angle QPR \cong \angle RPS$. Find the indicated measure.

9. $m\angle RPQ$

10. $m\angle RPS$

$$\begin{aligned} x + x + 60 &= 360 \\ 2x + 60 &= 360 \\ 2x &= 300 \\ \boxed{x = 150} \end{aligned}$$

$$= 150^\circ$$

$$\begin{aligned} 8ft &= r \\ \boxed{C = 116\pi ft} \end{aligned}$$

11. length of \widehat{QRS} $150 + 150 = 300$

13. length of \widehat{QR}

14. length of \widehat{RSQ}

$$\begin{aligned} \frac{300}{360} 116\pi \\ \frac{4800\pi}{360} \\ \boxed{l = \frac{40\pi}{3} ft} \end{aligned}$$

$$l = \frac{150}{360} 116\pi$$

$$\begin{aligned} 150 + 60 \\ = 210 \end{aligned}$$

$$\frac{2400\pi}{360}$$

$$l = \frac{210}{360} 116\pi$$

$$\boxed{l = \frac{20\pi}{3} ft}$$

$$= \frac{3360\pi}{360}$$

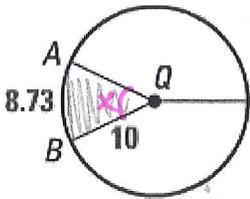

$$\boxed{l = \frac{28\pi}{3} ft}$$

Find the indicated measure.

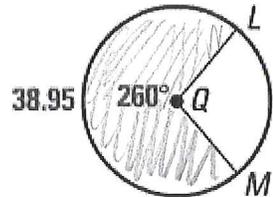

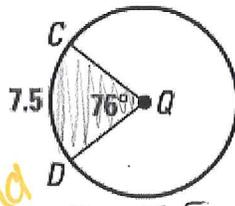

15. $m\angle AQB$

16. Circumference of $\odot Q$

17. Radius of $\odot Q$

$$\boxed{C = 20\pi}$$

$$8.73 = l$$

$$10 = r$$

$$l = \frac{a}{360} \cdot C$$

$$8.73 = \frac{a}{360} \cdot 20\pi$$

$$8.73 = \frac{a \cdot 20\pi}{360}$$

$$\frac{3142.8}{20\pi} = \frac{a \cdot 20\pi}{20\pi}$$

$$\boxed{50.0 = a}$$

must put () around 20π in calculator!

$$l = 7.5$$

$$a = 76^\circ$$

$$r = ? \quad d = ?$$

$$C = ?$$

$$\frac{360}{76} \cdot 7.5 = \frac{76}{360} C \cdot \frac{360}{76}$$

calculator

$$360 \times 7.5 \div 76$$

$$\boxed{C = 35.5}$$

$$38.95 = \frac{260}{360} C \cdot \frac{360}{260}$$

$$53.9 = C$$

Now find radius!

$$\frac{53.9}{\pi} = \frac{d\pi}{\pi}$$

$$17.15690287 = d$$

$$\div 2$$

$$\boxed{r = 8.6}$$

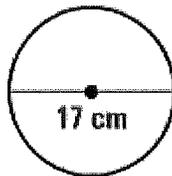

Circumference and Arc Lengths Notes

Use the diagram to find the indicated measure.

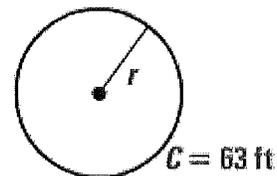

1. Find the circumference

2. Find the circumference

3. Find the radius

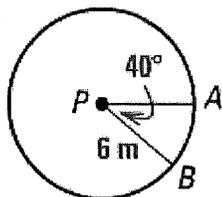

Find the indicated measure.

4. The circumference of a circle with diameter 5 inches.
